

Bangladesh Tourism Analytics: Insights and Implications

Problem

Bangladesh’s tourism data is scattered and underused. The aim was to convert raw data into decisions for operators, investors, and policymakers.

Method

- Merge and clean BBS/UNWTO datasets in Python (Pandas).
- Explore seasonality and regional trends with Matplotlib.
- Build interactive Power BI dashboards.
- Segment traveler types; light forecasting for peak months.

Insights & Implications

- Domestic spend dominates → invest in regional hospitality and transport.
 - Peak season Nov-Feb → schedule campaigns, festivals, capacity planning.
 - Underused heritage circuits → develop products and partnerships.
- Tools: Python (Pandas, Matplotlib), Power BI, Tableau, ARIMA for Forecasting • Segmentation
